

Anthropocene

Audiovisual Simulation of Human Impact on Nature

A living interactive installation that responds to human presence.

Anthropocene is not just a work of art, but an algorithmic mirror: a thriving digital forest that evolves — or devolves — into a dense, noisy urban landscape in direct response to audience attendance.

Phase 1: Genesis

Visual

Full natural landscape

Audio

Winds, rustling, and flowing water, natural sounds.

Phase 2: Colonisation

As soon as the sensors detect human presence, the equilibrium is broken. Each individual entering the space increases the "**anthropic level**" of the system.

- **Detection:** Cameras with MediaPipe track visitors in real-time.
- **Metamorphosis:** The vegetation stiffens. Organic branches mutate into geometric shapes; leaves become artificial lights etc...
- **Soundscape:** Metallic rhythms, distant engines, and urban frequencies are superimposed over the rustling of the wind. (audio granulation)

Phase 3: Saturation

Urban Dominance

Once a critical threshold of visitors is surpassed, the digital city takes complete control. Nature is suffocated by the city.

Visual/Auditory Chaos

Digital glitches, frantic traffic of luminous agents, and visual pollution saturate the screens.

Audio

The soundscape collapses into auditory chaos, reflecting the acoustic stress of modern cities.

The cycle concludes with **Collapse or Rebirth**: when the room empties, the structures disintegrate, allowing the forest to slowly regenerate as it was at the beginning.
