Abstract

The Anthropocene is commonly defined as the period in which humanity has become a planetary force of change, evolving at an increasingly rapid pace and profoundly reshaping the natural environment. Our goal is to raise awareness around this topic by offering an interactive experience that combines visual and sound-based storytelling.

Participants enter a room and are initially immersed in a pristine natural environment. The visuals and sounds evoke an uncontaminated landscape, a place where human presence seems absent or forbidden. But what happens when more people enter the space and begin to interact with it? Gradually, the environment responds. The landscape transforms, transitioning from an untouched natural scene into the urban and industrial imagery of a modern city. This change unfolds in real time, directly influenced by human presence and behavior.

The installation will be built around three core elements: a dynamic visual system capable of evolving over time, a sound engine generating the auditory landscape of the experience, and a sensor—preferably a camera—designed to detect presence and enable user interaction.

Is this transformation necessarily negative? This is the question we invite participants to reflect upon. By experiencing the consequences of interaction, users are encouraged to consider the impact of humanity on nature, the purpose and direction of this relationship, and the importance of understanding, acknowledging, and respecting what existed before us.
